Analytical Cume

September 9, 2016

The following questions are based on an article: Bakker, Eric; Pretsch, Erno Analytical Chemistry (2002), 74(15), 420A-426A

1. Without considering the article, explain the origin of the potential or EMF that develops across a membrane.
2. In the 1980's and '90's what were considered the lowest detection limits for ions using Ion Selective Electrodes (ISE)?
3. What was the fundamental discovery about ISE that lead to the improvements? The word ionophore would be important to include.
4. How was it possible to make improvements in sensitivity and selectivity simultaneously?
5. What changes to the inter solution of the ISC will help improve performance?
