Biochemistry Cumulative Exam
April 2, 2018

1) What is the wobble base pairing? (20pts)

2) Why is wobble base pairing important? (20pts)

3) Draw the structure of any pair of bases with wobble base pairing (bases only). (30pts)

4) Near cognate suppression of stop codons (TAG, TAA, and TGA) with amino acids may cause serious effects on living cells. Could you use the wobble base pairing theory to determine which amino acids could be incorporated into proteins at the corresponding positions of each stop codon? (Only list the possible codons for individual stop codons unless you can remember the genetic code table) (30pts)
