INORGANIC CUMULATIVE EXAM
January 21, 2000

Keeping up with the literature is a critical aspect of staying active in a research area. The answers to the following should be common knowledge to students and researchers active in the inorganic field.

1 (15 pts). There are three primary journals routinely read by "inorganic" chemists. Give the names of these journals

2 (15 pts). The articles in these journals are generally separated into three catagories; Communications, Articles and Notes. Describe the differences between the three (it may be useful to consider the criteria used by the editors).

3 (15 pts). These journals can also be accessed on the Web. How can this be done? You must be specific ("Search the web" is not a correct answer). Your answer should reflect some recent experience in this matter. What advantages do the on-line journals have over the hardcopies?

4 (55 pts). Briefly outline one article describing some aspect of inorganic chemistry that appeared in one of these journals in the last 6 months. Provide the journal name and approximate date.
