Inorganic Chemistry

October 1, 2010

An extensive web search based on this past Monday's seminar can make us to learn such a fact that in a typical biopharmaceutical company, one major technical challenge is how to purify important bioactive ingredients at an ultra-low cost. To meet the challenge, the company may need helps from a chemist knowing some basics of advanced inorganic chemistry.

Question-1. Please list three commonly-seen inorganic materials that this chemist could use to do the purification job effectively at low-cost (15').

Question-2. Please discuss these materials' advantages and disadvantages in doing the purification job (30').

Question-3. Please describe these materials' typical chemical compositions and their structural details in sub-nm and μm scales (45').
