INORGANIC CUMULATIVE EXAM

4-6-18

Answer any 5 of the following 10 questions (20 points each). Any answers provided beyond the requested five will not be graded. Remember: Your answers to these questions are meant to provide evidence of broad, graduate-school level chemistry knowledge. Consider this in your choice of terminology and examples as answers to these questions.

Group Theory and Symmetry

1) NH_3 and BH_3 have two different structures.

(a) Draw the structures for the monomeric forms of NH_3 and BH_3. Be sure to include perspective drawings where needed (hashes and wedges).

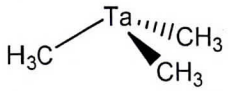
(b) To what point groups do these molecules belong?

Differences in the structures of NH_3 and BH_3 can be determined from the gas phase vibrational spectraof the monomers of each molecule.

2) Use the group theory method to determine how many IR and Raman active normal modes would be observed for NH_3 (show all your work)

3) The reducible representation for all of the normal modes of BH_3 is $\Gamma_{3N} = A'_1 + A'_2 + 3E' + A''_1 + A''_2 + E''$ How many IR and Raman active modes are expected for a BH_3 monomer? Which irreducible representations correspond to these normal modes of vibration?

Trimethyl tantalum has a trigonal pyramidal structure in the gas phase. A perspective drawing of Trimethyl tantalum is drawn below.



4) Using group theory, determine what orbitals on Ta are of appropriate symmetry to form Ta-Methyl sigma bonds? (Show all of your work)

5) Which orbitals on Ta are likely of the appropriate energy to form Ta-Methyl sigma bonds?

Solid State :

Cadmium Selenide Nanoparticles have been explored extensively for over 20 years. These particles have been found to be fluorescent. The wavelength of fluorescence of cadmium selenide nanoparticles changes drastically depending on the preparation of the nanoparticles.

6) What is the stoichiometry of cadmium selenide nanoparticles?

7) What one property primarily determines the fluorescence wavelength of cadmium selenide nanoparticles? Explain your answer.

Superconductivity was first discovered in 1911. In the 1950's Bardeen, Cooper and Schrieffer described a theory explaining superconductivity.

8) What experimental observations would lead you to conclude that your material is a superconductor?

9) Describe BCS theory.

Bulk semiconductors

10) Describe how p-doped silicon is produced.

Some Useful information

$$\# reps = \frac{1}{h}\sum(g * \chi_r * \chi_i)$$

h = total operations in a group

g = number of operations in a class

χ_r = the character of the reducible representation

χ_i= the character of the irreducible representation

The transformation matrix for a C_n rotation around the z axis is

$$\begin{bmatrix} cos\,\theta & -sin\theta & 0 \\ sin\theta & cos\,\theta & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$cos\frac{2\pi}{1} = 1, sin\frac{2\pi}{1} = 0$$

$$cos\frac{2\pi}{2} = -1, sin\frac{2\pi}{2} = 0$$

$$cos\frac{2\pi}{3} = -0.5, sin\frac{2\pi}{3} = \frac{\sqrt{3}}{2}$$

$$cos\frac{2\pi}{4} = 0, sin\frac{2\pi}{4} = 1$$

$$cos\frac{2\pi}{5} = \frac{1}{4}(-1+\sqrt{5}), sin\frac{2\pi}{5} = \frac{1}{4}\sqrt{10+2\sqrt{5}}$$

$$cos\frac{2\pi}{6} = 0.5, sin\frac{2\pi}{6} = \frac{\sqrt{3}}{2}$$

Character Tables

C_2	E	C_2		
A	1	1	z, R_z	x^2, y^2, z^2, xy
B	1	-1	x, y, R_x, R_y	yz, xz

C_3	E	C_3	$(C_3)^2$		
A	1	1	1	z, R_z	x^2+y^2, z^2
E	1 1	e e^*	e^* e	x+iy; R_x+iR_y x-iy; R_x-iR_y	(x^2-y^2, xy) (yz, xz)

e = exp(2πi/3)

C_4	E	C_4	C_2	$(C_4)^3$		
A	1	1	1	1	z, Rz	x^2+y^2, z^2
